### Five Easy Pieces

1. A car is traveling at  $25.0 \, m/s$  when the driver hits the brakes causing a constant deceleration of  $3.00 \, m/s^2$ . How far does the car go while stopping?

X=?, X0=0 V= 25mb, V0=0 a=-3m/s2

(a) 104m (b) 208m (c) 52m (d) 1250m  $= (25n/s)^2 + 2(-3n/s^2)(x)$ 

2. A man runs 80.0 m in the positive x direction with an average speed of  $2.00 \, m/s$ . He immediately turns around and runs 180.0 m in the opposite direction with an average speed of  $6.00 \, m/s$ . What is his average speed for the entire trip?

Speed = 
$$\frac{d}{dt} = \frac{2 \cos m}{\Delta t}$$
 (a)  $4.00 \, m/s$  (b)  $-2.00 \, m/s$  (c)  $3.71 \, m/s$  (d)  $-1.43 \, m/s$ 

$$\Delta t_{z} = \frac{80m}{2mls} = 40s$$

$$\Delta t_{z} = \frac{180m}{5mls} = 30s$$

$$\Delta t_{z} = \frac{180m}{5mls} = 30s$$

$$\Delta t_{z} = \frac{260m}{70s} = 3.71mls$$

$$\Delta t_{z} = \frac{180m}{5mls} = 30s$$

$$\Delta t_{z} = \frac{260m}{70s} = 3.71mls$$

$$\Delta t_{z} = \frac{180m}{5mls} = 30s$$

$$\Delta t_{z} = \frac{260m}{70s} = 3.71mls$$

A man on the top of a 132 m high cliff throws a ball upwards at 16 m/s. If air resistance can be ignored, which of the following is the correct set of data for the ball after it is thrown.

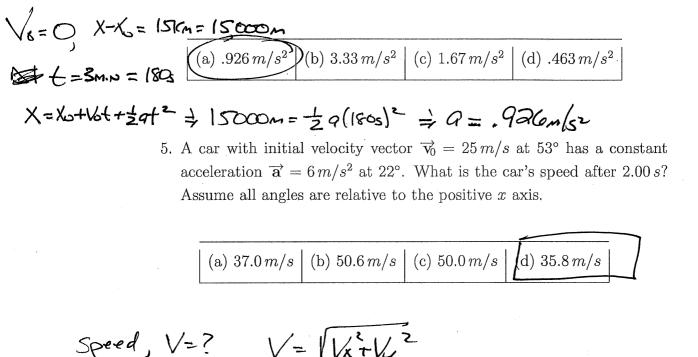

(a) 
$$y_0 = 0$$
,  $v_0 = 16 \, m/s$ ,  $a = -9.8 \, m/s^2$ 

(a) 
$$y_0 = 0$$
,  $v_0 = 16 \, m/s$ ,  $a = -9.8 \, m/s^2$  (b)  $y_0 = 132 \, m$ ,  $v_0 = 16 \, m/s$ ,  $a = -9.8 \, m/s^2$ 

(c) 
$$y_0 = 0$$
,  $v_0 = -16 \, m/s$ ,  $a = +9.8 \, m/s^2$  (d) Any of these three can be used.

But IF Down=positive, Vo=-16m/s, Q=+9.8m/s²

AN put yo Anywhere So yo= O AND yo=132m poss. Ble

what was its constant value of acceleration?

4. A car starts from rest at the origin. If it travels 15.0 km in 3.00 minutes,

Speed, 
$$V=?$$
  $V=V_{x}^{2}+V_{y}^{2}$ 

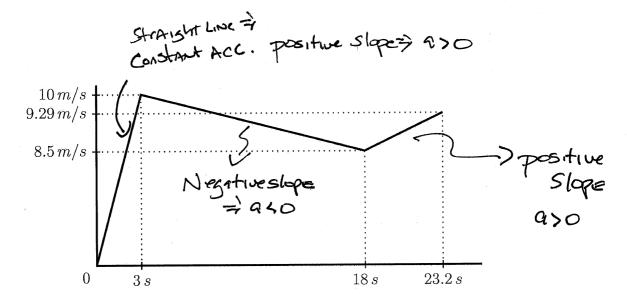

$$V=V_{0,x}+Q_{x}t=(25mb\cos 53^{\circ})+(6mls^{2}\cos 27^{\circ})(2s)=26.17mls$$

$$V_{y}=V_{0,y}+Q_{y}t=(25mls)\sin 53^{\circ}+(6mls^{2}\sin 22^{\circ})(2s)=24.46mls$$

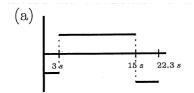

#### She Had Polio As A Kid!

Questions 6 through 10 refer to the following setup and figure.

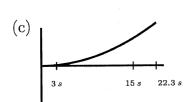

Wilma Rudolph was the first American woman to ever win three gold medals at the olympics. (And was the 20th of 22 children!!!) In the 1960 games in Rome, she won the  $200\,m$  dash with a time of  $23.2\,s$ . Assume that when plotted, Wilma's velocity as a function of time had the following shape. (Please notice that for clarity, this graph and the ones on the next page are not to scale. You may assume that the graphs have either straight lines or parabolic curves.)

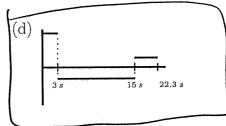

6. Which of the following acceleration versus time graphs is correct?

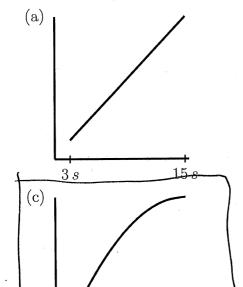

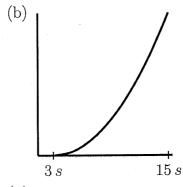

SEE PEVIOUS PAGE

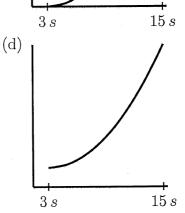

7. Assuming that the position origin is set at Wilma's t = 0 location, which of the following **position** versus time graphs is correct for times between 3s and 15s?

3s

 $\frac{1}{15}s$ 

From 3s to 5s, Q<0 @ 4 constant

= Parabola with Decreasing Slope 8. For all times between 18 s and 23.2 s, what was the acceleration value?

$$(a) -0.152 \, m/s^2 | (b) \, 0.152 \, m/s^2 | (c) -0.034 \, m/s^2 | (d) \, 0.034 \, m/s^2$$

$$Slipe = a = \frac{(9.29 \, m/s - 8.5 \, m/s)}{(23.25 - 185)} = \frac{.79 \, m/s}{5.2s} = -152 \, m/s^2$$

9. What distance did she cover during the first 3 s of the race?

$$X = X + V_0 + \frac{1}{2}at^2$$
 (a)  $16.1m$  (b)  $30m$  (c)  $15m$  (d)  $1.61m$    
Slope =  $Q = \frac{10mk}{3s} = (\frac{10}{3}mk^2)$ ,  $V_0 = 0 \Rightarrow X = \frac{1}{2}(\frac{10}{3}mk)(\frac{1}{3}s)^2 = 15m$ 

10. At t = 25 s, how fast was she going?

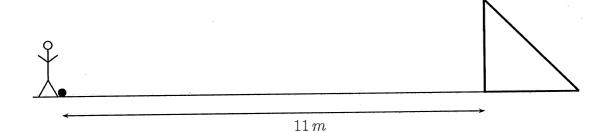

(a) 
$$3.8 \, m/s$$
 (b)  $12.3 \, m/s$  (c)  $9.56 \, m/s$  (d) Cannot be determined

PROBLEM ENDS Q += 23.25

## **Futball**

Questions 11 through 15 refer to the following setup and figure.

One of the most psychologically grueling aspects of soccer (aka football) is the penalty kick. A penalty kick is taken  $11\,m$  away from the goal. During a practice session, West Ham United's Carlton Cole kicks a football from the penalty spot with a speed of  $15\,m/s$  and at an  $18^\circ$  angle.

11. Which of the following is the correct pair of initial velocity components?

Vox= Vocasd = (15mb)65180 = 14.3 m/s

(a) 
$$v_{0,x} = 15 \, m/s$$
,  $v_{0,y} = 18 \, m/s$ 

(b) 
$$v_{0,x} = 11 \, m/s$$
,  $v_{0,y} = 15 \, m/s$ 

(c) 
$$v_{0,x} = 4.64 \, m/s$$
,  $v_{0,y} = 14.3 \, m/s$ 

(c) 
$$v_{0,x} = 4.64 \, \text{m/s}, \, v_{0,y} = 14.3 \, \text{m/s}$$
 (d)  $v_{0,x} = 14.3 \, \text{m/s}, \, v_{0,y} = 4.64 \, \text{m/s}$ 

Voly=Vosna = (15mb)=~18°=4.64mls

12. Ignoring air resistance, what is the maximum height reached by the

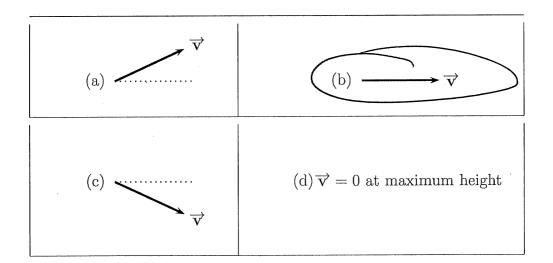

Ymrx =? Occurs when V/= 0

(a) 3.3 m (b) 2.49 m (c) 10.4 m (d) 9.8 m

$$3.3 \, m / (b) \, 2.19 \, \eta$$

t=.473s y=yo+b,yt+zgt=+y=(4.64mls)(473s)+z(-9.8mls)(.473s)2=1.09m

13. Ignoring air resistance, which of the vectors below gives the correct direction for the ball's velocity at its maximum height?

AT MAX. HEIGHT 1/20 BUT VX=VO,X=14.3m/S + Vector with only X-Component= -> 14. If we were to include air resistance, which of the following vectors would give the correct direction for the ball's acceleration at its maximum height? **HINT**: At the maximum height, gravity is causing a change in direction while air resistance would be causing a decrease in speed.

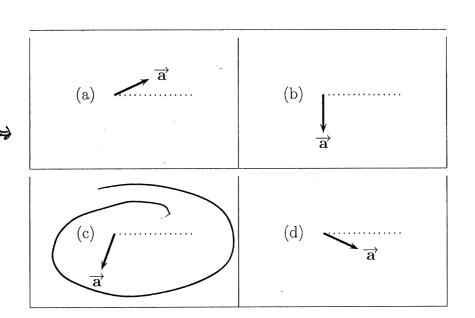

AT more height

Changing Direction =>
900 to 2

Aranging speed =>
parallel to 2.

Slaving Down =>
opposite to 2

The proposite to 2

15. Ignoring air resistance, in what direction is the ball traveling as it enters the goal (at x = 11 m)?

(a) 
$$-18^{\circ}$$
 (b)  $-11.6^{\circ}$  (c)  $0^{\circ}$  (d)  $-3.44^{\circ}$ 

$$V_{x} = V_{0,x} = 14.3 \text{m/s}$$

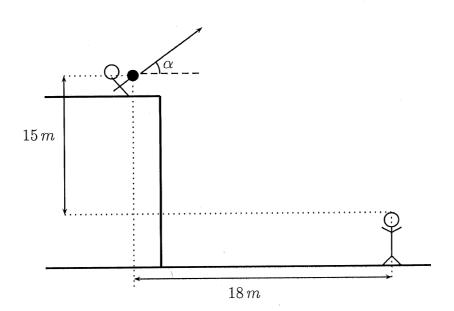

$$V_{y} = V_{0,y} + 9t = 4.64 \text{m/s} - 9.8 \text{m/s}^{2} t$$

FIND & FROM X = X0+V0,xt = IIm = (14.3m/s) + = = .769s = 14.64m/s - 9.8m/s²(.769s) = -2.90m/s

#### I Know You Want To!

Questions 16 through 20 refer to the following setup and figure.

One day you find in yourself in the following unlikely situation: You are standing on top of a building when you spot your instructor standing  $18.0\,m$  away and  $15.0\,m$  below you. (See the figure.) The unlikely (though fun) part is that you happen to have a water balloon launcher with you. You decide that you wish to hit the top of your instructor's head  $3.0\,s$  after launch. Ignore air resistance in all calculations.

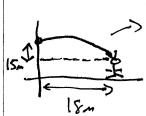

16. Which of the following equations would be used to find the balloon's launch angle, α?

LAUNCH ANGLE = INITIAL VELOCITY

(a) 
$$\tan^{-1}\left(\frac{v_y}{v_x}\right)$$
 (b)  $\alpha = \tan^{-1}\left(\frac{y}{x}\right)$  (c)  $\tan^{-1}\left(\frac{v_{0,y}}{v_{0,x}}\right)$  (d)  $\tan^{-1}\left(\frac{y_0}{x_0}\right)$ 

17. Which **TWO** of the following choices are correct listings of initial and final position values of the water balloon? Both answers are required for full credit.

(a) 
$$x_0 = 0$$
,  $y_0 = 0$ ,  $x = 15 m$ ,  $y = -18 m$  (b)  $x_0 = 0$ ,  $y_0 = 0$ ,  $x = 18 m$ ,  $y = -15 m$  (c)  $x_0 = 0 m$ ,  $y_0 = 15 m$ ,  $x = 18 m$ ,  $y = 0$  (d)  $x_0 = 0$ ,  $y_0 = 18 m$ ,  $x = 15 m$ ,  $y = 0$ 

18. What initial velocity x-component  $(v_{0,x})$  is necessary to hit the top of your instructor's head?

(a) 
$$6.0 \, m/s$$
 (b)  $18 \, m/s$  (c)  $5.0 \, m/s$  (d)  $8.7 \, m/s$ 

19. What initial velocity y-component  $(v_{0,y})$  is necessary to hit the top of your instructor's head?

(a)  $6.0 \, m/s$  (b)  $9.7 \, m/s$  (c)  $5.0 \, m/s$  (d)  $8.7 \, m/s$   $-15 m = V_{0,y}(3s) - 49.1(3s) - 49.1(3s)$ 20. The instant the balloon hits the top of your instructor's head, which of the following statements is true?

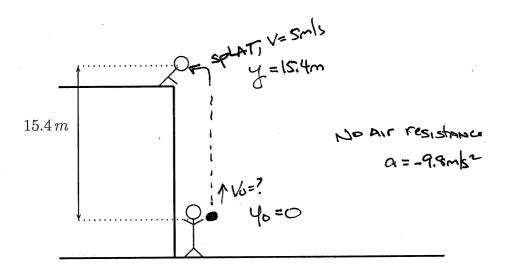

(a) $v_x$ is zero.	(b) $v_y$ is zero.	
(c) Both $v_x$ and $v_y$ are zero.	(d) Neither $v_x$ nor $v_y$ are zero.	>

Problem Ends WHEN BAlloon Hits HEAD => Still moving  $V_x = V_{0,x} = Com/s$   $V_y = V_{0,y} + gt = 9.7m/s - 9.8m/s^2(3s) = -19.7m/s$ 

NEITHER ARE ZERO

# 21. Revenge!

In retaliation for his soaking, your instructor get his OWN water balloon launcher! He stands directly below you and launches the balloon upwards. Ignore air resistance in all calculations.

(a) Through other methods (not currently available to you), your instructor determines that his water balloon needs a speed of at least  $5.0 \, m/s$  in order to burst upon contact with your face. With what minimum speed must your instructor launch his balloon in order to hit your face which is  $15.4 \, m$  directly above the launch point? (5pts)

$$V^{2} = V_{0}^{2} + 2a(y-y_{0}) \Rightarrow (5m/s)^{2} = V_{0}^{2} + 2(-9.8m/s)(15.4m)$$

$$\Rightarrow 25m/s^{2} = V_{0}^{2} - 301.84m/s^{2} \Rightarrow V_{0}^{2} = 326.84m/s^{2}$$

$$\Rightarrow V_{0} = [326.84m/s] = 18m/s$$

(b) Not content to be hit in the face with a water balloon, you grab your launcher and fire directly downwards with a speed of  $35 \, m/s$ , just .62 s after your instructor launches his balloon. When and where do the two balloons collide? Use your answer from part (a) for the initial speed of your instructor's balloon. If you were unable to find that value, use  $20.0 \, m/s$ . (15pts)

Two many spects: #1 = Instructor's Balloon, #2= your Balloon

For=1: 76=0, Vo=18mls, a=-9.8m/s2

#2: 10 = 15.4m, Vo = -35mls, a= -9.8mls?
