Extra Credit #3

Given Position, Find Velocity, AND Acceleration

a) Which graph? → 3 AND 4 are wrong because they don't connect the dots. 1 goes up to 10s which is too far since final data point is 9s.

c) Acceleration

WHAT Velocity vs. time graphs... ~~CHANGING~~

NOTICE: 3 line segments \Rightarrow
 3 Constant Acceleration Motions
 From 20 to 40s, horizontal
 line \Rightarrow UNIFORM MOTION $\Rightarrow a_x = 0$

a) what is initial velocity? \Rightarrow initial velocity at $t=0$. Just read off of graph $v_i = 0.5 \text{ m/s}$

b) what is total distance? \rightarrow For any type of motion Δx is Area under v_x vs. t . \leftarrow Hopefully you remember this in a hint or in the textbook.

split into 4 areas

Region 1: \triangle with base 20s and height $2 \text{ m/s} - 0.5 \text{ m/s} = 1.5 \text{ m/s}$
 $A_1 = \frac{1}{2} (20\text{s})(1.5 \text{ m/s}) = 15 \text{ m}$

Region 2: \square with width 20s and height 0.5 m/s
 $A_2 = (20\text{s})(0.5 \text{ m/s}) = 10 \text{ m}$

Region 3: \square with width $40\text{s} - 20\text{s} = 20\text{s}$ and height 2 m/s
 $A_3 = 20\text{s}(2 \text{ m/s}) = 40 \text{ m}$

Region 4: \triangle with base $50\text{s} - 40\text{s} = 10\text{s}$ and height 2 m/s
 $A_4 = \frac{1}{2} (10\text{s})(2 \text{ m/s}) = 10 \text{ m}$

$$\Delta x = A_1 + A_2 + A_3 + A_4 = 15\text{m} + 10\text{m} + 40\text{m} + 10\text{m} = 75\text{m}$$

c) What is a_{av} over first 20s?

$$a_{\text{av}} = \frac{\Delta v}{\Delta t} \quad \text{for } t_i = 0, t_f = 20\text{s}$$

$$v_i = 0.5\text{m/s}, v_f = 2\text{m/s}$$

$$a_{\text{av}} = \frac{v_f - v_i}{t_f - t_i} = \frac{(2\text{m/s} - 0.5\text{m/s})}{(20\text{s} - 0)} = \frac{1.5\text{m/s}}{20\text{s}} = 0.075\text{m/s}^2$$

This question is a little silly since v_x vs t straight line \Rightarrow constant acceleration, so the instantaneous acceleration value for $0 < t < 20\text{s}$ is also 0.075m/s^2 , and both a_{av} and a_x are the slope of the line.

d) What is instantaneous acc. at $t = 45\text{s}$. \rightarrow Again, straight line for 40s to 50s \Rightarrow instant. acc. is constant for all times between 40s and 50s

$$\text{AND } a_x = \frac{\Delta v}{\Delta t} = \text{slope} \quad \text{here use } t_i = 40\text{s}, t_f = 50\text{s} \Rightarrow v_{x_i} = 20\text{m/s}$$

$$v_{x_f} = 0$$

$$\Rightarrow a_x = \frac{(0 - 20\text{m/s})}{(50\text{s} - 40\text{s})} = \frac{-20\text{m/s}}{10\text{s}} = -2\text{m/s}^2$$

e) which is correct a_x vs t graph?

We know $a_x = 0.075 \text{ m/s}^2$ for first 20s

for 40s to 50s, $a_x = -0.2 \text{ m/s}^2$. As I mentioned at very beginning

from 20s to 40s, $a_x = 0$ since v_x graph is horizontal

\Rightarrow 3 constant graphs \Rightarrow 3 horizontal lines

2.12

a) What is Avg. Acceleration for 0 to 10s?

$$a_{av} = \frac{\Delta v}{\Delta t}$$

$$v_2 = 60 \text{ km/h}, v_1 = 0$$

$$\Delta t = 10 \text{ s}$$

Have to use m/s to get m/s^2

$$\frac{60 \text{ km}}{\text{h}} \times \frac{1000 \text{ m}}{1000 \text{ km}} \times \frac{\text{h}}{3600 \text{ s}} = 16.667 \text{ m/s}$$

$$a_{av} = \frac{16.667 \text{ m/s}}{10 \text{ s}} = 1.6667 \text{ m/s}^2 = 1.7 \text{ m/s}^2 \text{ to 2 sig figs}$$

b) what is a_{av} from 30s to 40s. Now $v_2 = 0$, $v_1 = 60 \text{ km/h} = 16.667 \text{ m/s}$

$$\Delta t = 40 \text{ s} - 30 \text{ s} = 10 \text{ s}$$

$$\text{So } a_{av} = \frac{0 - 16.667 \text{ m/s}}{10 \text{ s}} = -1.7 \text{ m/s}^2$$

c) from 10s to 30s: $v = 60 \text{ km/h}$ constant $\Rightarrow \Delta v = 0 \Rightarrow a_{av} = 0$

d) From 0 to 40s, $v_2 = 0$ at 40s, $v_1 = 0$ at 0s

$$\Rightarrow a_{av} = 0$$

e) What is instant. Acceleration at 20s? \mathbf{F}

The slope for 10s to 30s is zero at every point so $a = 0$

\Rightarrow ^{instant.} What is acceleration at 35s?

From 30s to 40s, plot is straight line \Rightarrow constant slope

$\Rightarrow a = a_{av}$ for 30s to 40s $\Rightarrow a = -1.7 \text{ m/s}^2$
