## June 9, Week 2

Today: Chapter 2, Acceleration

Homework \#2 now available on webpage

## Example

$$
\begin{gathered}
x_{f}=x_{i}+\left(v_{x}\right)_{i} \Delta t+\frac{1}{2} a_{x}(\Delta t)^{2} \quad\left(v_{x}\right)_{f}=\left(v_{x}\right)_{i}+a_{x} \Delta t \\
\left(v_{x}\right)_{f}^{2}=\left(v_{x}\right)_{i}^{2}+2 a_{x} \Delta x
\end{gathered}
$$

Example: A car is traveling on a straight road with a speed of $30.0 \mathrm{~m} / \mathrm{s}$ when the driver hits the brakes causing a constant deceleration of $2.5 \mathrm{~m} / \mathrm{s}^{2}$. How long does it take and how far does the car go while stopping?
